

CSS Assignment #2

CSS Lesson 1

Formatting Exercise 2

Create an **external style sheet** for a new site with the following characteristics and apply it to a new web page.

Background Image -

- Create a background image that is 800x600 (or find an image and use Fireworks to convert it to 800x600)
- Save the background image in the same folder as the CSS file and Web page.
- Change the background so that it does NOT TILE either vertically or horizontally, and is fixed (ie, does not move when you scroll).

Hyperlinks, Visited links, and Text -

- Format the text to create a color scheme that matches your background. In this scheme, choose different colors for the text and links.
- All text and links should use a 10 pt Verdana font.

Hyperlink Hovering -

- Include a hover command that shows a clear difference between the normal link. However, DO NOT include a command that makes the text a larger size.

Once you have created your style sheet, apply it to a separate web page. In the page, insert a table that is one row, one column, and 500 px wide. In the table, include a hyperlink, as well as several paragraphs so that you MUST scroll down the page. To generate text, go to www.lipsum.com and generate 7-8 paragraphs to copy into your page.

When finished, print the CSS file **and** show me your finished page.
